And install android studio gradle offline

```
code2care@mac ~ % gradle -v

-----
Gradle 6.8.3
-----

Build time:   2021-02-22 16:13:28 UTC
Revision:    9e26b4a9ebb910eaa1b8da8f

Kotlin:      1.4.20
Groovy:      2.5.12
Ant:         Apache Ant(TM) version 1.10.11 compiled Jul 14 2020
JVM:         11.0.10 (JetBrains s.r.o)
OS:          Mac OS X 11.2.3 aarch64
```

Add an Android app

Register app Download config file Add Firebase SDK Run your app to verify installation

```
// add the Firebase SDK for Google Analytics
implementation 'com.google.firebase:firebase-analytics:17.2.2'
// add SDKs for any other desired Firebase products
// https://firebase.google.com/docs/android/setup#available-libraries
```

Finally, press "Sync now" in the bar that appears in the IDE:

Gradle files have changed since last sync. **Sync now**

Android studio doesn't install app. Android studio offline install. How to install android studio on android phone. Download and install android studio gradle offline. Can't install android studio.

If your PC does not have a high configuration, you will be able to run other applications like Google Chrome when your Android Studio is in execution. See how to fix it. Do you want a holiest way to manage library versions? If you want to edit this project ID, you should do this now because it can not be changed after FireBase Provisions features for your project. Click Create Project (or Add Firebase, if you are using an existing Google cloud project). } In your gradle file of your module (application level) (usually app / build.gradle), apply the Gradle Plugin from Google Services: Apply plugin: 'com.android.application' // Add the following Line: Apply plugin: 'with.google.gms.google-services' // Google Services android plugin (// ... is that! Be sure to check the next recommended steps. (Optional) Configure Google Analytics for your project, which allows you to have an ideal experiment using any of the following FireBase products: Select an existing Google Analytics account or to create a new account. When the process is completed, you will be taken to the general vision page of your Firebase project on the Firebase console. Gradle Builds Using the Android Gradle (AGP) plugin V4.2 or earlier need to enable Java 8 support. Declare them in your Gradle Mode (App / Build.gradle) file. In the Wizard pane, follow the remaining configuration instructions for your selected FireBase product. To create a new project, enter the name of the desired project. The SSD has actually faster than Rough Disk Drives. Step 3: Adjust the Memory Configuration for Appearance and Behavior >> System Settings >> Memory Settings. So upgrade to the latest version is a useful stage for you if you are in execution in the versions old. In previous versions, Android Studio was more heavy Google software is updating and making it more scaldable for developers. If we are not having a high PC configuration, we should not work in many applications at the same time and also should do the Build for two applications at a time. Learn more about this construct failure in this FAQ. You can download your FireBase configuration file again at any time. To correct this compilation failure, you can follow one of the two options: Add the listed compilations of the error message to your application level.gradle file. If you create a new account, select the Analytics Report location and accept the data sharing settings and the Google Analytics terms for your project. But these are the minimum requirements. It is often observed that Android Studio is actively consuming 4GB RAM. Note that FireBase SDKs with a dependence on Google Play services requires that the device or emulator have installed Google Play services. Disabling, helps perform a smoother construction process. // Import the good fireball implementation platform ('com.google.firebase:firebase-good:29.3.1') // When using the good, you do not specify versions in the FireBase Library Dependencies // declares the dependence on FireBase SDK for Google Analytics 'com.google.firebase:firebase-analytics-ktx' // declare dependence on any other desired FireBase // for example, declare dependence For firebase authentication and Firestore Firestore implementation 'com.google.firebase:firebase-auth-ktx' 'implementation' 'com.google.firebase:firebase-firestore-ktx' Using good android firebase android, your application will always use compatible versions of the Android libraries of FireBase. Now to use Analytics or a product that recommends adding analysis (see table below), you need to explicitly declare the dependence of analysis: com.google.firebase:firebase-analytics or com.google.firebase:firebase-analytics-ktx. Sometimes I need much more time than it should then a painful process. The Android FireBase Library FireBase-Core is not more necessary. You can see >> Windows Tool >> GRADLE, and then click on icon alternated offline mode. Visit Understanding Understand Projects to learn more about this configuration file. Learn more about these Android libraries: Note that when using FireBase's good Android, you do not specify individual library versions when you declare dependence on the FireBase library in Build.gradle. Libraries available This section lists FireBase products supported for Android and their gradient dependence. A slow Android studio is a butt pain for an Android developer. A package name exclusively identifies your application on the device and in the Google Play store. This workflow also adds the Android configuration file from your FireBase project (Google-Services.json) to the module directory (application level) of your application. Step 2: Register your application with FireBase in the Android application, you need to register your application with your FireBase project. Step 3: Add a FireBase configuration file Add FireBase android configuration file to your application: Click Google-Services.json download to get your configuration file The Android of FireBase (Google-Services.json). It will save our time in developing an application and will also go through a painful process at the time of development. A, minimum space and configuration requirements: The officially Android Studio requires a minimum of 4 GB of RAM, but 8 GB of RAM is recommended for it. Visit Understand FireBase Projects to learn more about FireBase projects. We can always enable the online compilation process when we need it. It can also speed up your Android Studio. step 5: Release space and cacheore Cleaning the Gradle Cache: In Windows: % UserProfile% \ .gradle \ CACHESON MAC: / UNIX: ~ / .gradle / Cache / To Clean Cache All Android Studio: Archive >> Invalidate Cache and Restart. Step 6: Delete Not used and unwanted in our folder Android Studio projects, many garbage applications may also exist we created in some way, but we did not do any work in these applications. We must work on a single project at a time. Step 8: Try to run the On a fanic device instead of an emulator android studio provides emulators to run our application for development purposes. We must execute our application on a fanic device instead of this emulator, will lead to a soft development process. FireBase generates an exclusive ID for your FireBase project based on the name you give. At the center of the project general vision, click on the Android (Plat. android) or add application to start the configuration workflow. Enter the name of your application package in the Android Package Name field. To do this, open preferences >> plugins and disable the plugins you are not using. How is the application nickname the Signature Certificate of Share Default used in the firebase? What do you need to know about this configuration file? Be aware that the value of the package name is sensitive to maia. If we are doing this, it can cause our PC to be hanged. Let's try to configure an android stamium as a charm so we can perform a smoother development environment. Step 1: Create a firebase project before adding FireBase to your Android app, you need to create a firebase project to connect to the Android app. Create a FireBase FireBase Project, click Add Project. The applications that exist are not necessary for you, you can exclude these unwanted applications, it will release space and remove an unwanted load of Android Studio. It will save our time and escape the unnecessary checks for dependence. Java is a trademark of Oracle and / or its affiliates. To add resources from To an existing Google Cloud project, enter your project name or select it from the drop-down menu. So, if you are confident enough for your PC, you did not download any malware file from sites or places not allowed, so you do not Turn off antivirus. (Optional) Enter other application information: Nickname app and SHA-1 debug signature certificate. You can create this new Android application from the new FireBase in an existing FireBase project or a new project. Click Connect to FireBase to connect your Android project with FireBase. If you do not have an Android project and you just want to try out a FireBase product, you can download one of our QuickStart samples. I do not think there's a need to tell you that, as you can turn off the antivirus from your PC that you would know about it. 5: Disable the Android Stupid Proxy Server proxy server is turned off on Android Studio, but in some cases, your proxy server may be on. Click Continue. It also requires a minimum of 2 GB disk space, but the 4GB disk space is recommended for it. Emulators provided by them will also be putting an extra charge and making the Android Studio bulky that can be a cause for the Android Studio suspension. You can always configure Google Analytics later on the Integrations tab of your project settings. These are the few best tips to reduce Gradency Compilation Time. Step 1: Activate offline workmany horns do not need to go with the online compilation process Gradle, we can do it offline. Click Register App. Saturday update 2022-04-19 UTC. Synchronize your application to ensure that all dependences have the necessary versions. Increase Minsdkversion for your Android design for 26 or above. Why do not you do it in offline mode? // Import the good fireball implementation platform ('com.google.firebase:firebase-good:29.3.1') // When using the good, you do not specify versions in the FireBase Library Dependencies // declares the dependence of FireBase SDK for implementation of Google Analytics 'com.google.firebase:firebase-analytics-ktx' // declares the dependence on any other desired FireBase // product for example, declare dependence on firebase authentication and implementation of Firestore Cloud Cloud Implementation ('com.google.firebase:firebase-firestore') Depends (// ... It will also help accelerate the graduation process. Can you refer to the article how to run the Android application on a real device? Step 9: Updating Android Studiogoogle is also trying to make the IDE smoother and faster for development. You can use the Alternative Kotlin Extensions (KTX) libraries that allow you to record the cute and idiomatic kotlin code. Buildscript (repository (// Make sure you have the following line (if not, add it): Google () // the repository of the Google Maven) Depends (// ... a package name is frequently referred to as an application ID. In the Assistant panel, choose a FireBase product to add to your application. Go to the firebase console. To activate FireBase products in your application, add the Google Services plugin to your Graduarua files. An antivirus is by pattern, not giving direct access to Android for these files that it will check the file and then provide access. He does not just quickly in his Android studio as well will fast his PC 2 to 3 times. Click the button to add a desired FireBase product (for example, Add Analytics to your application). Repository (// Verify that you have the following line (if not, add it): Google () // repository Maven of Google // ... Move your configuration file in the module directory (Application level) from your application. It is also annoying that when you are concentrating on the logic for your application, and you have a kick to work and at that time your Estery Android suddenly begins to be late. // Add the following line: ClassPath 'com.google.gms: Google-Services: 4.3.10' // Google Services Plugin} AllProjects (// ... but also heavy software that will suck your computer a "ç à" e rams. The value of From the package is sensitive to maia. He is trying to

Use the following options: Option 1: (Recommended) Use the Firebase Console Configuration Workflow. Register now Install or update Android Studio for your last version. You can use the good Firebase android to manage your Firebase library versions and ensure that your application is always using compatible library versions. If contrary, these Android projects obtain a compile failure when adding a firebase SDK. Go to Build.Gradle (Module: App) and add this block.dexOptions {Incremental True} Note: from Android Gradle Plugin 8.0 forward, there is no need to use DexOptions as the AndroidGradle plugin optimizes Dexing automatically. Add so many other products from What you would like through the Firebase Assistant! Are you using Kotlin? What is a package name and where do you think? What does this workflow do? To deactivate it, it is for file >> Configuration >> Aparánia and Behavior >> >> Settings >> http proxy and select no proxy.à € The softer and more fast android studio made some factual settings to accelerate the gradient compile process. Activating Graduation Daemon will also help accelerate the process of construct. To do so, check the following path: C:\ User % User% \ AndroidStudioProjects and delete these applications Garba.Step 7: Try to use a single project in a timewe spoke before in the topic that heavy software is android Studio and how heavy is the process of the application's graduation. Enter Firebase using your Google account. A lot of heap allocation is not a good thing.Step 4: Ignore thumbs.dbgo to archive >> Editor >> Editor >> File types >> and in the Ignore Files and Folders field Add thumbs.db. Make sure that the name of the configuration file is not attached with additional characters, such as (2). Again, click on the icon will disable offline step 2 mode: Activate gradle daemon and parallel construction parallel reducing the graduation compensation horms , that it will build modules in parallel. Go to Gradle Scripts >> gradle.properties and add these two code lines. # When configured, the gradle will be run in parallel mode incubating # This option should only be used with disco projects.org.gradle.parallel = true # When set for truth, the gradient daemon is used to run the compile. This SDK included the firebase SDK for Google Analytics. If prompted, review and accept Firebase terms. This workflow automatically creates a new Android from Firebase using the name of the package of your application. // Import the implementation platform of good firebase (com.google.firebase: Firebase-Good: 29.3.1) // When using the good, you do not specify versions in the Firebase library dependencies // declares the dependence on the Firebase // products for example, declare dependence on firebase authentication and Firestore Firestore implementation com.google.firebase: AERH Base Aerh Deployment } Depends (// ... Note: The firebase configuration file contains unique identifiers, but not secret for your project. Getting a Construction Failure on Custom Invsion Support and Enabling Corrugating? Depends (// ... That's it! You can skip for the front to check the next recommended steps. Find the name of your application's package in the Gradle file of your module (application level), usually app / build.gradle (example of package package: com.yourcompany.yourproject). Expand your section, and then click the tutorial link (for example, Analytics> Log of an Analytics event). If you create a new project, we strongly recommend that you configure Google Analytics for your project, which allows you to have an ideal experience using many firebase products. Mayy Steps Add Firebase Services to Your Application: Learn about Firebase: Except as otherwise indicated, the content of this page is licensed under the Creative Commons Attribution 4.0 licenses and the code samples are licensed On the Apache 2.0 licenses. // Import the implementation platform of good firebase (com.google.firebase: Firebase-Good: 29.3.1) // When using the good, you do not specify versions in the Firebase library dependencies // declares the dependence on the desired Firebase // products for example, declare dependence on Firebase Authentication and Firestore Firestore implementation com.google.firebase: firebase-auth- KTX (implementation) com.google.firebase: Firebase-Firestore-KTX) Using the good Firebase Android, your application will always use compatible versions of the Android libraries of Firebase. Therefore, use it no effect. Step 4: Disable Antivirus in Gradle Compilation Process. Android Estone needs to access several files repeatedly. You really do not feel right at that moment. Firebase Provides resources for your Firebase project. Adjust these settings according to your preference. Now let's make some configurations that can help us make our Android Estone more fast.Step 1: Deactivate useful inurable It can be many plugins on Android Studio that you are not using. Here are some tips on setting up your Firebase project: Visit Understand Firebase Projects to learn more about the best practices and considerations to add applications to a Firebase project, including how to deal with various construction variants Q. The firebase configuration file contains unique identifiers, but not secret for your project. This article will be divided into two parts in the first part that we will see that, as we can accelerate the process of construction of Android Studio and in the second part we will know that as we can fast this slow and heavy software called Android Studio. Accelerate Your Gradle Compilation Process The Gradle Construction is the most important part of the development of an Android application. We can turn it off for now. Increase a bit of heap size can help. The file verification procedure first, and then give Android Studio access decelerates the graduation compilation process. Option 1: Add Firebase Using Firebase Console Adding Firebase to Your Application involves tasks both on the firebase console and in your open Android project (for example, you download Firebase files Convigao Console, then move them to your Android project). Make sure you have the repository of Google Maven also. In the Root Gradle File (Build.Gradle), add rules to include the Google Gradle Services plugin. } Step 4: Add Firebase SDKs to your application using good Android from Firebase, declare dependencies for firebase products you want to use in your application. Option 2: Add Firebase Using the Firebase Wizard The Firebase Wizard registers your application with a firebase project and adds the files, plugins and dependence Needed on your Android project - all from Inroid Studio! Open your Android project on Android Studio and make sure you are using the latest versions of Android Studio and the Firebase Wizard: Windows / Linux: Linux: > Check MACOS updates: Android Studio> Verify that there are updates to open the Firebase Wizard: Tools> Firebase. For details, see the Google Developer Web site policies.
